It seems that the undesirable effects of concurrent transaction executions can be put into three classes: violation of integrity constraints, inconsistent outputs to users and racing. An intuitive way to define correctness of transaction schedules is then to require that the scheduler avoid all three types of anomalies. In this paper, we formalize this notion of correctness. To do this, we develop a new, desirable, semantic property of transaction schedules, which we call independence. Then, we give a partial answer to the following question: Is there any intermediate class of schedules, between the classes of serializable and correct schedules, that has an easy membership test? We first prove a negative result. For integrity constraints in the form of linear inequalities and for linear semantics of transaction actions, we show that the serializable schedules are the only class of schedules preserving those integrity constraints. However, if the semantics of transaction actions are more restricted, then there exists a class of nonserializable schedules (we call them weakly serializable of order 2) which is a proper subset of the class of correct schedules and has an easy membership test.
